Welcome

Thank you for choosing the AdderView DDX system. This adaptive system makes sharing numerous host computers among multiple users straightforward and flexible. Every computer is linked, via its USB and video ports, to a compact DDX-CAM module while each set of peripherals are connected to a DDX-USR module (to form Consoles).

The various computers and consoles are then linked, via CAT6a or CAT7 cable with S/FTP, S/STP or PiMF shielding (see Appendix 1 for details), to a central DDX switch. Each user can then, subject to the privileges granted by the admin, gain quick access to any of the required computers.

If required, computers and consoles can be individually connected in order to take advantage of the DDX extender properties without the switching.

An integral part of DDX switches is the DDX Matrix, a browser-based configuration and management tool that allows one or more remote admin user(s) to monitor and maintain all aspects of operation.

**Cable type and distance rules**
- Cable screening/shielding is required. The best cable shielding specifications for use with the DDX system are: S/FTP, S/STP or PiMF.
- Extension distances up to 50m are supported with single uninterrupted runs of recommended cable (shielded CAT6a or CAT7 cable).
- CAT5 or CAT5e cables must NOT be used with this product.
- Overall cable runs must be reduced by 5m for each additional cable coupling.
- All patch cables should be as short as possible and should be no longer than 2m.
- It is recommended that Adder shielded CAT7 cables are used for maximum performance.

**IMPORTANT:** Always ensure you are using shielded cables.
Access permissions

The DDX switch uses a system of hierarchal Access permissions to mediate between numerous consoles and multiple computers. Each console is granted the use of up to four types of access permissions to each computer, most of which influence how other users can gain simultaneous access to the same computer. The four access permissions, and their effects on other console users are as follows:

- **VIEW ONLY**
  The console user can view the chosen computer’s output but cannot control it.
  Once selected, other consoles can simultaneously use VIEW ONLY, SHARED ACCESS or EXCLUSIVE for the same computer.

- **SHARED ACCESS**
  The console user can view and control the chosen computer’s output.
  Once selected, other consoles can simultaneously use VIEW ONLY or SHARED ACCESS for the same computer.

- **EXCLUSIVE**
  The console user can view and control the chosen computer’s output.
  Once selected, other consoles can simultaneously use VIEW ONLY for the same computer.

- **PRIVATE**
  The console user can view and control the chosen computer’s output.
  Once selected, all other consoles are completely locked out from the same computer.

*Note: The hierarchy of permissions shown here increases from left to right.*
**Port designations - DDX10**

By default the DDX10 switch provides 8 computer ports (1 to 8) and 2 user console ports (9 to 10), all on its rear panel, however, these designations are not fixed. If your installation requires a greater number of consoles, you can alter the allocation of these standard ports to suit:

**DDX10 REAR PANEL**

Any of the 20 rear panel computer ports can be reallocated as user console ports.

For more details, please see [Realocating ports](#).

---

**Port designations - DDX30**

By default the DDX30 switch provides 10 user console ports on its front panel and 20 computer ports along its rear panel, however, these designations are not fixed. If your installation requires a greater number of computers or has a need for more user consoles, you can alter the allocation of these standard ports to suit:

**FRONT PANEL**

Ports 21 to 23 can be reallocated as computer ports.

---

Any of the 20 rear panel computer ports can be reallocated as user console ports.
SUPPLIED ITEMS

DDX switch package

AdderView DDX10 switch

AdderView DDX30 switch

Information wallet containing:
- Four self-adhesive rubber feet
- Safety document

Power adapter with locking connector and country-specific power cord

19" rack mount brackets and four screws
DDX-USR package

- DDX-USR module
- Power adapter with locking connector and country-specific power cord
- Information wallet containing:
  - Four self-adhesive rubber feet
  - Safety document

DDX-CAM DisplayPort option

- DDX-CAM module with USB and DisplayPort connections
  - Part number: DDX-CAM-DP

DDX-CAM DVI option

- DDX-CAM module with USB and DVI-D connections
  - Part number: DDX-CAM-DVI

DDX-CAM VGA option

- DDX-CAM module with USB and VGA connections
  - Part number: DDX-CAM-VGA
**OPTIONAL EXTRAS**

- **USB cable 2m (type A to B)**
  - Part number: VSC24

- **Audio cable 3m (3.5mm stereo jacks)**
  - Part number: VSC22

- **CAT7 shielded cable**
  - 3m
    - Part number: VSCAT7-3M
  - 10m
    - Part number: VSCAT7-10M
  - 30m
    - Part number: VSCAT7-30M
  - 50m
    - Part number: VSCAT7-50M

- **DVI-D 2m cable**
  - Part number: VSCD1

- **Replacement power adapter with locking connector for DDX-USR module**
  - Part number: PSU-IEC-12VDC-1.5A

- **Country-specific power cords**
  - CAB-IEC-AUS (Australia)
  - CAB-IEC-EURO (Central Europe)
  - CAB-IEC-UK (United Kingdom)
  - CAB-IEC-USA (United States)
  - CAB-IEC-JAPAN (Japan)

- **Dual DDX-USR rack mount bracket plus four retaining clamps and bolts**
  - Part number: RMK8

- **Additional or replacement power adapter with locking connector for DDX switch**
  - Part number: PSU-IEC-12VDC-5A

- **Country-specific power cords**
  - CAB-IEC-AUS (Australia)
  - CAB-IEC-EURO (Central Europe)
  - CAB-IEC-UK (United Kingdom)
  - CAB-IEC-USA (United States)
  - CAB-IEC-JAPAN (Japan)
LOCATIONS
Please consider the following important points when planning the position of the AdderView DDX modules:

• If used, position the DDX switch in a central position that serves the host computer systems and user modules without exceeding the maximum link lengths. It will also require a source of mains power.
• Situate each DDX-USR module close to the peripherals to which it will be connected and near to a source of mains power.
• Consult the precautions listed within the Safety information section.
CONNECTIONS

Connections do not need to be carried out in the order given within this guide, however, where possible connect the power in as a final step. Connections are split into the following three areas:

- **Computer connections** - a DDX-CAM module links to each host computer.
- **Switch connections** - when used, a DDX switch unit sits at the heart of the system.
- **Console connections** - the peripherals (keyboard, display, etc.) connect to DDX-USR modules.

**Computer connections: Video**

Three types of DDX-CAM modules are available:

- DVI-D and USB
- DisplayPort and USB
- VGA and USB.

If a computer has more than one video output, use additional DDX-CAM modules to separately link the additional video stream(s) with other ports on the DDX switch.

**To connect the video port**

1. Connect the video lead of the DDX-CAM to the DVI-D, DisplayPort or VGA video port on the host computer.

**Computer connections: USB**

Each DDX-CAM module requires a single USB connection to the computer. This provides essential power for the DDX-CAM module in addition to the USB signals. Each DDX-USR module acts as a USB 2.0 hub and thus provides four sockets for peripherals.

**To connect the USB port**

1. Connect the USB cable of the DDX-CAM module to a vacant USB socket on your host computer.

**Computer connections: Data link**

Each DDX-CAM module is linked via a shielded (S/FTP or S/STP) CAT6a or CAT7 cable either to a central DDX switch module or directly to a DDX-USR module (for a single system installation).

Maximum link cable lengths:

- DDX-CAM to DDX switch - 10 metres (32 feet) maximum.
- DDX-CAM to DDX-USR module - 50 metres (164 feet) maximum.

**To link the DDX-CAM module**

1. Connect the RJ-45 plug of the link cable to the socket located at the end of the DDX-CAM module.

IMPORTANT: Always ensure you are using shielded cables.
Switch (DDX10) connections: Computer links

The host computer links are made to the sockets on the rear panel of the DDX switch.

To connect a computer link

1. Connect a shielded (S/FTP or S/STP) CAT6a or CAT7 cable (10m maximum) from the remote DDX-CAM computer module to a vacant RJ-45 socket (sockets 1 to 8, by default) on the rear panel of the DDX10 switch.

- These are NOT Ethernet/network ports and must NEVER be connected to any networking equipment.

Switch (DDX10) connections: User console links

The user console links are made via the sockets on the rear panel of the DDX switch.

To connect a user console link

1. Connect a shielded (S/FTP or S/STP) CAT6a or CAT7 cable (50m maximum) from the remote DDX-USR module to a vacant RJ-45 socket (sockets 9 and 10, by default) on the rear panel of the DDX10 switch.

- These are NOT Ethernet/network ports and must NEVER be connected to any networking equipment.

Quick Reference

- IMPORTANT: Always ensure you are using shielded cables.

Reallocating ports

By default the DDX10 switch provides 8 computer ports and 2 user ports along its rear panel. If necessary, these standard arrangements can be changed. See Reallocating ports.

Switch (DDX30) connections: Computer links

The host computer links are made to the sockets on the rear panel of the DDX switch.

To connect a computer link

1. Connect a shielded (S/FTP or S/STP) CAT6a or CAT7 cable (10m maximum) from the remote DDX-CAM computer module to a vacant RJ-45 socket on the rear panel of the DDX30 switch.

- These are NOT Ethernet/network ports and must NEVER be connected to any networking equipment.

Switch (DDX30) connections: User console links

The user console links are made via the sockets at the front of the DDX switch.

To connect a user console link

1. Connect a shielded (S/FTP or S/STP) CAT6a or CAT7 cable (50m maximum) from the remote DDX-USR module to a vacant RJ-45 socket on the front panel of the DDX30 switch.

- These are NOT Ethernet/network ports and must NEVER be connected to any networking equipment.

Quick Reference

- IMPORTANT: Always ensure you are using shielded cables.
Switch connections: **Network link**
All system configuration is carried out via an Ethernet link, allowing adjustments to be made by authorized admin users located next to the DDX unit, or anywhere. The auto-sensing network port can determine between 10, 100Mbps or 1Gbps links and can also adjust to straight or cross-over cables.

**To connect a network link**
1. Connect the CATx cable from an Ethernet switch or from a local computer.

Switch connections: **Options port**
The options port is reserved for future use.

*From a network switch or nearby computer*
Switch connections: Power
Each DDX switch is supplied with a single power adapter but offers the facility to use a second input in order to provide operational redundancy. The DDX unit can operate perfectly well from a single power adapter operating alone. When two adapters are connected, the unit will spread its load between them; should one power input fail, 100% of the load will be transferred to the other power adapter without a break in operation. Remote checking of the power inputs is possible at any time via the browser interface - see Maintenance > Diagnostics for details.
There is no on/off switch on the DDX unit, so operation begins as soon as power is applied at either port.

To connect the power adapter
1. Attach the output plug of the supplied power adapter to either power input socket on the left side of the rear panel.
2. Connect the IEC connector of the supplied country-specific power cord to the socket of the power adapter.
3. Connect the power cord to a nearby main supply socket.
4. Where power redundancy is required, repeat steps 1 to 3 for a second power adapter.

To disconnect the power adapter
1. Isolate the power adapter from the mains supply.
   Note: If you are replacing one of dual power adapters during operation, it is not necessary to also remove power from the other adapter.
2. Grasp the outer body of the power adapter plug where it connects with the module.
3. Gently pull the body of the outer plug away from the module. As the body of the plug slides back, it will release from the socket and you can fully withdraw the whole plug.

IMPORTANT: Please read and adhere to the electrical safety information given within the Safety information section of this guide. In particular, do not use an unearthed power socket or extension cable.
Note: Both the modules and the power supplies generate heat when in operation and will become warm to the touch. Do not enclose them or place them in locations where air cannot circulate to cool the equipment. Do not operate the equipment in ambient temperatures exceeding 40 degrees Centigrade. Do not place the products in contact with equipment whose surface temperature exceeds 40 degrees Centigrade.
Console connections: **Video**
A Single Link DVI-D port is provided on the rear panel of the user module. The DDX-USR module supports one video display with pixel clocks up to 165MHz (equivalent to a maximum resolution of 1920 x 1200 at 60Hz - aka ‘WUXGA’).

If a second display is required to support a dual video installation, use another DDX-USR module to drive the second display, and combine the two user modules into a single Console within the DDX Matrix configuration application - See [Configure > Computers](#).

**To connect the video display**
1. Connect the DVI-D video cable from your video display to the video output port on the rear panel of the user module.

**EDID management**
The DDX switch provides a number of fixed EDID (Extended Display Identification Data) profiles that will suit a large number of video display configurations. If additional EDID definitions are required for your installation, you can clone new definitions from connected video displays and add these to the list of available definitions.

For details about cloning EDIDs from displays, see [Add EDID](#).
For details about applying an EDID to a particular computer, see [Configure > Computers > Transmitters](#).

**DDX-USR module switches**
The two switches on the DDX-USR module are reserved for future use and must both remain in the OFF position.

---

**Console connections: ****USB**
The DDX-USR module contains a USB hub that can support up to four v1.1 or v2.0 USB devices (in any combination). All four USB sockets, two on the front panel and two on the rear, are identical in operation.

*Note: In multi-head installations, the USB devices must be attached only to the DDX-USR module that drives the main display.*

**To connect USB devices**
1. Connect your USB keyboard and mouse to any of the four sockets distributed on the front and rear panels of the user module.
Console connections: Audio
The DDX-USR module supports stereo speakers, headphones and also a microphone port. All audio devices are presented at the linked host computer as USB audio devices.

*Note: In multi-head installations, the audio devices must be attached only to the DDX-USR module that drives the main display.*

**To connect your speakers**
1. Connect your speakers to the audio line out socket on the user module rear panel.

**To connect your headphones/microphone**
1. Connect your headphones to the socket labeled on the user module front panel.
2. Connect your microphone to the socket labeled on the user module front panel.

---

Console connections: Data link
Each DDX-USR module is linked via shielded (S/FTP or S/STP) CAT6a or CAT7 cable either to a central DDX switch module or directly to a DDX-CAM module (for a single system installation) - do not exceed 50 metres (164 feet).

**To link the DDX-USR module**
1. Connect a shielded (S/FTP or S/STP) CAT6a or CAT7 cable to the LINK socket on the rear panel of the DDX-USR module. Connect the other end of the cable to either a DDX switch or directly to a DDX-CAM computer module.

> **IMPORTANT:** Always ensure you are using shielded cables.

---

Console connections: Options port
The options port is reserved for future use.
**Console connections: Power**

There is no on/off switch on the DDX-USR module, so operation begins as soon as power is applied. The supplied power adapter uses a locking-type plug to help prevent accidental disconnections; please follow the instructions given right whenever disconnecting a power adapter.

**To connect the power adapter**

1. Attach the output plug of the supplied power adapter to the power input socket on the rear panel of the DDX-USR module.

2. Connect the IEC connector of the supplied country-specific power cord to the socket of the power adapter.

3. Connect the power cord to a nearby main supply socket.

**To disconnect the power adapter**

1. Isolate the power adapter from the mains supply.
2. Grasp the outer body of the power adapter plug where it connects with the module.
3. Gently pull the body of the outer plug away from the module. As the body of the plug slides back, it will release from the socket and you can fully withdraw the whole plug.

**IMPORTANT:** Please read and adhere to the electrical safety information given within the Safety information section of this guide. In particular, do not use an unearthed power socket or extension cable.

Note: Both the modules and the power supplies generate heat when in operation and will become warm to the touch. Do not enclose them or place them in locations where air cannot circulate to cool the equipment. Do not operate the equipment in ambient temperatures exceeding 40 degrees Centigrade. Do not place the products in contact with equipment whose surface temperature exceeds 40 degrees Centigrade.
**ACCESSING DDX MATRIX**

DDX switches are configured via their network connections using an intuitive browser-based application, called **DDX Matrix**. This secure, password protected application is accessible by any authorized user, located anywhere. The DDX switch can also be accessed via cross origin resource sharing (CORS). This allows interaction in a browser from a different web application. The API is served in a YAML format which can be found at http(s)://<ipaddress>/rest-api. The DDX switch adheres to RESTful and CORS standards.

**To access DDX Matrix**

1. Use a computer that is directly or indirectly (i.e. via a network switch) connected to the DDX switch. If you need to make a temporary connection, see right.

2. Run a web browser on your computer and enter the IP address of the DDX switch. The DDX switch uses the Universal Plug and Play (UPnP) protocol for Windows, or Bonjour (mDNS-SD) protocol for Mac and Linux, to contact a valid DHCP server to determine a suitable IP address. If a DHCP server cannot be located then the switch will automatically fall back to a static IP address of 192.168.1.22. This address selection system can be configured later.

   Whichever method the switch uses, the initial IP address can be discovered either:
   - Using the Windows network browser (of a computer connected to the same sub network or directly to the switch), or
   - In the lower right corner of the OSD screen (of a console connected to one of the user ports) see Viewing the OSD.

   **Note:** For security, DDX Matrix uses HTTPS by default with a self-signed certificate - Please ignore any warnings that may be displayed by your web browser.

3. If requested, enter your username and password to log on.

   **Note:** The default username and password are admin and password respectively.

The opening page of the DDX Matrix should be displayed:
USING DDX MATRIX

The Dashboard page
Once you have successfully logged in, DDX Matrix will show the dashboard page to provide a general overview of your DDX installation. You can also re-display this page by clicking the Dashboard entry in the menu:

Information and options are displayed within the main section of the page.
Some items will provide further popup information when you hover your mouse pointer over them.

Click a heading to reorder the whole list in ascending or descending order according to the entries within the chosen column.

Colors and symbols are used to provide quick visual feedback:
- Operational with a valid video signal
- Operational but firmware upgrade suggested
- Not useable, firmware upgrade required
- Disconnected
  Note: An icon showing orange is currently being upgraded

Click the required menu item to reveal the available page choices.

Note: An icon showing orange is currently being upgraded

Note: It is not possible to remain logged in for more than 24 hours; after the webUI token has expired, you will need to log in again.
Quick guide to creating a new installation
When creating a new DDX installation there are various configuration tasks that need to be completed within DDX Matrix. This page provides a recommended ‘to do list’ of the stages that you need to perform.

Primary tasks
• Configure the networking details for the DDX switch.
  See Configure > Central Switch > Network
• Ensure that the EDID definitions are appropriate for your installation.
  If additional EDID definitions are required for your installation, you can clone new definitions from connected video displays and add these to the list of available definitions.
  See Add EDID
• Add the required consoles (either before or after they are connected).
  By default the DDX switch provides 20 computer ports along its rear panel and 10 user ports along its front panel. If necessary, these standard arrangements can be changed to suit your installation.
  See Reallocating ports
• Determine the access permissions for each console.
  See Access permissions
• Add your computers (either before or after they are connected).
  See Configure > Computers
• Add the users and define their login details.
  See The Users Page

Secondary tasks
• Optionally make changes to the OSD settings.
  See Configure > Central Switch > OSD Settings
• Add description and location details for the switch.
  See Configure > Central Switch > General
The Control page

The Control page provides a Connection map that allows the admin user to view and affect how consoles are connected to the various computers. This page is particularly useful when managing video-only installations.

To connect a console

1. Click the down arrow on the console entry to reveal the list of computers that it is authorized to access.

2. Click the appropriate connection icon adjacent to the required computer:
   - View only - console user can view a computer’s output but not alter it,
   - Shared access - console user can view and control a computer along with other consoles,
   - Exclusive - multiple console users can view a computer but only one can control it, or
   - Private - console user can view and control the computer privately while other users are locked out.

For further details, see Access permissions.

3. You can change the connection method at any time by clicking the down arrow again and choosing an alternative connection option.

To disconnect a console

1. Click the button in the lower left corner of the console entry that you wish to disconnect.
The Configure pages

The Configure menu option expands when clicked to reveal three sub-sections:
- **Central Switch** - settings related directly to the DDX switch.
- **Consoles** - settings related to the DDX-USR modules and their connected peripherals.
- **Computers** - settings related to the DDX-CAM modules and their host computers.

Central Switch > General

Basic settings for the DDX switch. Description/Location are most useful when multiple DDX installations are being managed; labelling each installation as you go is a good habit to get into:
- **System Default EDID** - determines the default EDID to use for the installation.
- **Ignore Firmware Mismatch** - when set to On, this overrides the checks that are made to ensure all modules are running compatible firmware versions. This override should be used in exceptional circumstances only.
- **Manage Time Automatically** – when set to ON the current time and timezone will be obtained via the configured NTP & DHCP servers.
- **Use Current PC Time** - when managing time manually, the system time will be synced to that from the local computer.
- **Timezone** - when managing time manually or running without DHCP, allows you to declare which timezone you are in.

When the Maintenance > Settings > Web UI Mode is set to Advanced, an extra Versions block is displayed below the General section for diagnostic purposes:

- **Firmware Version** - shows the firmware version of the DDX switch.
- **Recovery Version** - shows the version of the DDX switch recovery image.
- **Admin UI Version** - shows the version of the DDX Matrix admin user interface.
- **Board Version** - shows the version of the main DDX motherboard.
- **Datafpga Version** - shows the version of the gate array chip that handles data throughput.
- **Videofpga Version** - shows the version of the gate array chip that handles video signals.
Central Switch > Network

All of the key settings for the network capabilities of the DDX switch are here:

- **IP Address** - shows the current IP address for the switch.
- **Net Mask** - shows the current subnet mask to accompany the IP address.
- **Gateway** - shows the current address for a gateway device.
- **DHCP and (Fallback) Address Scheme** - using these two options you can determine how the IP address of the DDX switch should be derived. See below.
- **MAC Address** - displays the unique (and fixed) MAC address for the switch.
- **Web Server Protocol** - allows a change to the use of insecure HTTP for web admin - switch reboot required. **IMPORTANT**: Do not set this option to HTTP when the switch is connected to external networks.
- **Network Service Discovery** - when set to Disabled, the switch will not announce its presence on the network and will not be discoverable using the Windows network browser on a network-connected computer.
- **Hostname** - provides a way to access the DDX Matrix by using this hostname together with the domain name (http(s)://<hostname>.<domain>), removing the need to know the IP address.
- **Advertise DHCP Domain Name** - when set to Off, the DDX switch will use its locally applied domain name in order to appear in the Apple® Bonjour (mDNS-SD) service (this is necessary on some incorrectly configured networks that use the local top-level domain). When set to On, the DDX switch will broadcast its DHCP-supplied name to the Bonjour service.
- **DHCP NTP Address** - when DHCP is On, this area lists the addresses of time servers being used. This service is only supported if the option 42 NTP server is enabled on the DHCP server. If the alternate timezone option 4 is in use, the IP address of the NTP server will not be displayed.
- **Manual NTP Address** - allows you to enter the static IP addresses of up to five NTP servers (an average of the time feeds from the servers is taken).

**DHCP and (Fallback) Address Scheme**
These two options together determine the manner in which the IP address of the DDX switch is configured. If **DHCP** is set to **ON** and is available via the network, then the IP address will be set by DHCP.
If **DHCP** is set to **OFF** or is unavailable, then the (Fallback) Address Scheme setting comes into play. Whenever the **Static** option is chosen, you will be able to enter the required IP Address, Net Mask and Gateway options.
Central Switch > OSD Settings
Options related to the on screen display are presented in this section:

- **Thumbnails** - when set to Off, this option will hide the thumbnail views of each computer within each user's OSD main page.

- **Auto Layout** - when set to Off, this option will maintain a 5x5 grid for the displayed computers within the OSD main page, regardless of the number of available computers. When set to On, the OSD view grid will be re-scaled accordingly.

- **Use Full Grid** - when set to On, if you have 4, 9 or 16 computers connected, the OSD will use the bottom right portion of the screen as a square computer thumbnail, instead of reserving it for the system information. A small tab appears in the top right corner of the OSD if “Show System Info” is On, showing the IP address and an icon denoting any compatibility issues (green tick for no issues, yellow warning for upgrade recommended and a red warning for upgrade required).

  Note: This option will be hidden if Auto Layout is set to Off.

- **Display System Info** - when set to On, the current IP address and firmware version details for the DDX switch will be shown in the lower right corner of the OSD, or the IP address and firmware icon in the top right corner of the OSD.

  Note: Disabling 'Display System Info' will remove the IP address from the OSD. When 'Use Full Grid' is enabled, this option will also suppress all firmware version mismatch warnings.

- **Display Date and Time** - when set to On, the current date and time are displayed on the OSD menu.

- **Background Brightness** - determines the brightness of the OSD thumbnail views when the mouse is not hovering over them. Five settings are available, from 100% down to 20%. If set to 100% then all thumbnails remain at full brightness all of the time. Whereas, at 20% all thumbnails will darken until the mouse hovers over one of them, at which point it will come to full brightness to clearly highlight it against all the others.

- **EDID** - optionally allows you to determine a video resolution to use when displaying the OSD. For instance, if you have a 19” monitor that can only display 1024x768 then by changing this setting to 1024x768 you can match the OSD to the screen resolution. Firmware versions below v3.0 will only display the OSD at a resolution of 1920x1080. After this setting has been changed, the system will reboot automatically.

  WARNING: This is a global setting and will be applied to all the monitors connected to the system. Before making changes, ensure that all your monitors can support this video resolution. If you have different sized monitors, this option should be set to the video resolution of the smallest monitor to ensure that you can bring up the OSD on all the monitors connected to your system.
Central Switch > Manage EDIDs

This page lists the EDID (Extended Display Identification Data) profiles that are currently available:

- **EDID** - shows the resolutions and refresh rates for all profiles that are currently stored.
- **Type** - indicates where each EDID profile originated: Fixed EDIDs are included within the switch firmware and cannot be removed. User EDIDs are those that have been cloned from particular video displays attached to DDX-USR modules - these can be deleted if required. On the main Central Switch > General page you can select the ‘Default System EDID’ from the list of fixed and user EDIDs.
- **Originating Port** - indicates which switch port supplied each user EDID.
- **Active Transmitter Ports** - indicates which transmitters (if any) are currently using each EDID.

Note: The DDX switch will modify the EDID, if a Dual link monitor is connected, to list only the video resolutions that it is capable of supporting.

Add EDID

If additional EDID definitions are required for your installation, you can clone new definitions from connected video displays and add these to the list of available definitions.

Click the [+] icon to begin collecting a new EDID from a display attached (via a DDX-USR module) to one of the switch ports.

Click the EDID dropdown list and choose the appropriate receiver (DDX-USR module) from which you wish to clone a new EDID profile. Then click the Add EDID button.

For details about applying an EDID to a particular computer, see Configure > Computers > Transmitters.
Configure > Consoles

A Console is a collective term for a set of peripheral devices arranged around one or more DDX-USR modules. This page lists all registered consoles:

- **Ports** - each DDX-USR module connects to a single port on the DDX switch. This column lists the port(s) used by the DDX-USR module(s) associated with each console. Two or more DDX-USR modules can be combined to form multi-head consoles, each connecting to separate ports.
  
  **Note:** For consoles with multiple displays (multi-head), additional user console ports are required. If there are no spare user console ports available then any unused computer ports on the rear panel can be deleted in order to free them up as spares. See *[Reallocating ports]*.

- **OSD Mouse Launch** - when set to On, allows the console user to invoke the on Screen Display by holding down their center mouse button and then clicking the right button.

- **Connected Computer** - shows to which computer the console is currently connected.

- **Current Access Mode** - indicates how the console is currently connected to the listed computer: ![View only](Image), ![Shared access](Image), ![Exclusive](Image), ![Private](Image)

- **Tick box** - Allows you to tick all required console entries and then remove them collectively using the Delete Selected button.

### In addition to the Name and Description, other columns provide the following details and options for each console entry:

- **Ports** - each DDX-USR module connects to a single port on the DDX switch. This column lists the port(s) used by the DDX-USR module(s) associated with each console. Two or more DDX-USR modules can be combined to form multi-head consoles, each connecting to separate ports.

### Click a heading to reorder the whole list in ascending or descending order according to the entries within the chosen column.

### Add new

Click the [+] icon to begin adding a new console, either before or after connecting the DDX-USR module(s). See *[Configure > Consoles > Add new entry]*

### Edit

Click an entry to view/edit its details. See *[Configure > Consoles > Edit an entry]*
Configure > Consoles > Add new entry
Click the [+] icon within the Configure > Consoles list to display this page and begin adding a new console, either before or after connecting the DDX-USR module(s):

Add new
• **Name** - the main identifier for the new console.
• **Description** - a further opportunity to add more information.
• **OSD Mouse Launch** - when set to On, allows the console user to invoke the on Screen Display by holding down their center mouse button and then clicking the right button.
• **OSD Touchscreen Launch** - when set to On (and when a touchscreen is being used at the console), a translucent launch icon is overlaid onto the primary screen and can be dragged to an appropriate location. When the icon is tapped, the OSD will be launched as normal.
• **OSD Hotkey Modifiers** - allows you to alter the standard hotkey modifiers that, together with the **OSD Launch Key** cause the OSD to be displayed on the console.
• **OSD Launch Key** - allows you to alter the standard key that, together with the **OSD Hotkey Modifiers**, causes the OSD to be displayed on the console.
• **VCP Key** - determines the key that, together with the **OSD Hotkey Modifiers**, causes the Virtual Control Panel to be displayed. The Virtual Control Panel allows users to adjust various aspects of their video image (when viewing an analog VGA source). See Using the Virtual Control Panel to adjust VGA inputs.
• **Keyboard Layout** - determines the overall keyboard layout to use with the console.
• **Port** - add the port number (located on the main DDX switch) used by the DDX-USR module associated with this console. For multi-head consoles, ensure that the port used by the primary DDX-USR module (the one that has the primary display and peripherals attached) is the first one to be defined. If a chosen port is already used, a warning will be displayed, see Reallocating ports.
• **Access Permissions** - click the [+] button to select one or more computers that this console will be permitted to access. For each computer choose the appropriate access permissions (see Access permissions): View only, Shared access, Exclusive, Private.
• **Preset Connection** - allows you to choose which computer this console should connect with (and which Access Permissions should be used) when the Connect to Preset option is clicked on the Control page. Any changes made here will modify any existing settings for this console which may already exist within the overall preset.
• **Add Console** - click to save your settings.
Configure > Consoles > Edit an entry
Click on an entry within the Configure > Consoles list to display this page. Here you can edit the configuration details for a chosen console.

### Edit
- **Name** - the main identifier for the console.
- **Description** - a further opportunity to add more information about the console.
- **OSD Mouse Launch** - when set to On, allows the console user to invoke the on Screen Display by holding down their center mouse button and then clicking the right button.
- **OSD Touchscreen Launch** - when set to On (and when a touchscreen is being used at the console), a translucent launch icon is overlaid onto the primary screen and can be dragged to an appropriate location. When the icon is tapped, the OSD will be launched as normal.
- **OSD Hotkey Modifiers** - allows you to alter the standard hotkey modifiers that, together with the **OSD Launch Key** cause the OSD to be displayed on the console.
- **OSD Launch Key** - allows you to alter the standard key that, together with the **OSD Hotkey Modifiers**, causes the OSD to be displayed on the console.
- **VCP Key** - determines the key that, together with the **OSD Hotkey Modifiers**, causes the **Virtual Control Panel** to be displayed. See also page 38.
- **Keyboard Layout** - determines the overall console keyboard layout.
- **Ports** - shows the user port number(s) (located on the main DDX switch) used by the DDX-USR module(s) associated with this console. For multi-head consoles, ensure that the port used by the primary DDX-USR module (the one that has the primary display and peripherals attached) is the first one to be defined. If a chosen port is already used, a warning will be displayed, see Reallocating ports.
- **Access Permissions** - choose which computers this console is permitted to access:
  - **View only** - console user can view a computer’s output but not alter it.
  - **Shared access** - console user can view and control a computer along with other consoles.
  - **Exclusive** - multiple console users can view a computer but only one can control it, or
  - **Private** - console user can view and control the computer privately while other users are locked out.

For further details, see Access permissions.
- **Preset Connection** - allows you to choose which computer this console should connect with (and which Access Permissions should be used) when the **Connect to Preset** option is clicked on the Control page. Any changes made here will modify any existing settings for this console which may already exist within the overall preset.

When you have made your changes, click the Update button.
Configure > Consoles > Receivers

At the heart of each console (the collective term for a set of peripherals connected to the DDX system) is a receiver called a DDX-USR module.

This page shows various details for each DDX-USR module:

- **Firmware** - the current internal software version for each DDX-USR module.
- **Monitor No** - an index number for each video display. The first monitor for any console will be indexed as ‘1’. Where a console has more than one video display associated with it (by using additional DDX-USR modules), this column will show ‘2’, ‘3’, etc. against the secondary, tertiary, etc. DDX-USR module(s).
- **Monitor model** - indicates the video display model as reported to the DDX-USR module to which it is connected.
- **Unique ID** - (shown only when the Maintenance > Settings > Web UI Mode is set to Advanced) this column displays the unique identifier hardwired into every DDX-USR module.

Click a receiver entry to view the configuration details of the DDX switch port to which it is connected.

Click a receiver entry to view the configuration details of the DDX switch port to which it is connected.

Within this page it is possible to reboot and/or recover a receiver.

**Recovering a receiver**

This option (shown only when the Maintenance > Settings > Web UI Mode is set to Advanced) is used to reprogram a receiver that has failed during a firmware upgrade. Once the Recover Receiver button is clicked, you will be asked to power cycle the respective receiver, whereupon it will boot up into recovery mode. Then you will asked to click a Reprogram button to commence the operation.
Configure > Computers
This page lists the computer systems that are connected to the DDX switch unit via individual DDX-CAM modules:

In addition to the Name and Description, the columns also provide the following useful details for each computer entry:

- **Ports** - each DDX-CAM module connects to a single port on the DDX switch. This column lists the port(s) used by the DDX-CAM module(s) associated with each computer. Two or more DDX-CAM modules can be combined to support extra displays (multi-head), each connecting to a separate port. Three of the user console ports (21 to 23) can be changed into computer ports, if there are fewer user consoles within your installation. See Reallocating ports.

- **Thumbnail** - indicates whether a thumbnail image of the computer’s video output will be shown on the OSD screen for each user. If disabled (unticked), a black image will be shown in the OSD screen.

- **Primary Console** - indicates the console that currently has control of the computer.

- **Connected Consoles** - lists all consoles to which each computer is attached.

- **Current Access Mode** - indicates how the computer is currently being accessed by the listed console:
  - = View only,
  - = Shared access,
  - = Exclusive,
  = Private

- **Tick box** - Allows you to tick all required computer entries and then remove them collectively using the Delete Selected button.

Add new
Click the [+] icon to begin adding a new computer, either before or after connecting the DDX-CAM module(s):

- **Name** - the main identifier for the new computer.

- **Description** - a further opportunity to add more information about the computer.

- **Computer Number** - provides a list of the remaining vacant computer numbers that you can associate with your new entry. The chosen number will determine the position of this computer in the OSD screen and also the hotkey (Ctrl+Alt+n) used to access it. You can swap the number used with other computers within the edit page.

- **Ports** - Add one or more port numbers used by the DDX-CAM module(s) associated with this computer.

Edit
Click an entry to view/edit its details and options. See Configure > Computers > Edit an entry.
Configure > Computers > Edit an entry

This page allows you to edit the configuration details for a chosen computer.

**Edit**

- **Name** - the main identifier for the computer.
- **Description** - a further opportunity to add more information about the computer.
- **Computer Number** - displays a list of computer numbers (used and vacant) that you can associate with this entry. The chosen number will determine the position of this computer in the OSD screen and also the hotkey (Ctrl+Alt+n) used to access it. If you choose a computer number that is already used by another computer, then it and the existing number held by this computer will be swapped over.
- **Port(s)** - shows the one or more port numbers used by the DDX-CAM module(s) associated with this computer. For multi-head computers, ensure that the port used by the primary DDX-CAM module (the one linked to the primary video output) is the first one in the list. Three of the user console ports (21 to 23) can be changed into computer ports, if there are fewer user consoles within your installation. See Reallocating ports.
- **Thumbnail** - indicates whether or not a thumbnail view of this computer's video output should be shown OSD screen for each user.
- **Primary Console** - indicates the primary console that is connected to this computer.
- **Connected Consoles** - indicates other consoles that are also connected to this computer.
- **Current Access Mode** - indicates the highest level access mode (e.g. View Only, Shared, Exclusive, etc.) that is currently being used for this computer.
- **Transmitters** - lists the transmitters (DDX-CAM modules) that are serving this computer.

When you have made your changes, click the Update button.
Configure > Computers > Transmitters

Each computer connects to a DDX-CAM transmitter module. This page lists each DDX-CAM module and their key details:

- **Computer Name** - the given name for each connected computer.
- **Firmware** - the current internal software version for each DDX-CAM module.
- **Monitor No** - an index number for each video display port. The first port for any computer will be indexed as ‘1’. Where a computer has more than one video display connected to it (by using additional DDX-CAM modules), this column will show ‘2’, ‘3’, etc. against the secondary, tertiary, etc. DDX-CAM module(s).
- **Unique ID** - (shown only when the Maintenance > Settings > Web UI Mode is set to Advanced) this column displays the unique identifier hardwired into every DDX-CAM module.

Click a transmitter entry to view the configuration details of its port on the DDX switch. Within this page it is possible to reboot and/or recover a transmitter.

### Applying a different EDID

If a computer needs to use an EDID profile that differs from the one being used as the default System EDID, use these steps:

1. If necessary, clone the required EDID - see **Add EDID**.
2. View the Configure > Computers > Transmitters page and click on the required computer entry (to show the page above).
3. Select the appropriate entry from the **EDID** drop down list.
4. Click the Update button.

### Recovering a transmitter

This option (shown only when the Maintenance > Settings > Web UI Mode is set to Advanced) is used to reprogram a transmitter that has failed during a firmware upgrade. Once the Recover Transmitter button is clicked, you will be asked to power cycle the respective transmitter, whereupon it will boot up into recovery mode. Then you will be asked to click a Reprogram button to commence the operation.

Click a heading to reorder the whole list in ascending or descending order according to the entries within the chosen column.
Reallocating ports
By default the DDX switch provides 10 user console ports on its front panel and 20 computer ports along its rear panel, however, these designations are not fixed. If your installation requires a greater number of computers or has a need for more user consoles, you can alter the allocation of these standard ports to suit:

- Any of the 20 rear panel computer ports can be reallocated as user console ports, or
- Three of the front panel ports (labeled 21 to 23) can be used as computer ports.

To reallocate a port that is already being used
1 While creating (or editing) a computer or console entry, choose the required port.
   If the port is already being used, when you click the Update button, you will be presented with a warning such as the following:

   ![Confirm Action]

   You have selected ports that are currently allocated to other computers/consoles.
   If you continue ALL ports for the following computers/consoles will be deallocated:
   - Console 63 (Ports: 23)

2 Click the Confirm button. The chosen port will first be de-allocated from its existing relationship and then paired to your device. The device that originally used the port will be left without a port allocation and will need separate attention.

Note: If you reallocate any port from a multi-head computer/console this will cause all ports associated with that computer/console to be de-allocated.
The Users page
This page lists all registered users and allows the admin user to add, edit and delete entries, as required.

Note: When changes are made to user details, you are recommended to make a backup file.

Add new
Click the [+] icon to begin adding a new user.

Edit
Click a user entry to edit its details.

Note: It is not possible to delete the Administrator account if it is the only administrator account remaining.
The Maintenance pages
The Maintenance section contains three pages: Diagnostics, System Operations and Settings.

Maintenance > Diagnostics
This page provides important feedback on power inputs (and switch Temperatures). The temperature information is displayed only when the Maintenance > Settings > Web UI Mode is set to Advanced.

This section indicates the status of the mains power input(s).

These items are only shown when Settings > Advanced Mode On is chosen.

This section indicates the current temperature readings within the DDX switch for the following:
• The processor core,
• The internal case area,
• The main circuit board,
• The red, green and blue video switches.

This section lists the currently active ports, their uptime and status.

The Maintenance pages
The Maintenance section contains three pages: Diagnostics, System Operations and Settings.

Maintenance > Diagnostics
This page provides important feedback on power inputs (and switch Temperatures). The temperature information is displayed only when the Maintenance > Settings > Web UI Mode is set to Advanced.

This section indicates the status of the mains power input(s).

These items are only shown when Settings > Advanced Mode On is chosen.

This section indicates the current temperature readings within the DDX switch for the following:
• The processor core,
• The internal case area,
• The main circuit board,
• The red, green and blue video switches.

This section lists the currently active ports, their uptime and status.
**Maintenance > System Operations**
This page provides a selection of important system operations that may be required at various times.

### System Operations

**System Version: 3.00.0342**

**Upgrade Firmware**
Upgrades the firmwares of the DDX switch and all connected modules to the latest version. Confirmation is required once this button is clicked.

*Note: On a fully populated switch with all the ports in use it will take an additional minute in order to apply the upgrade than a switch with only one or two ports in use.*

If the switch is on its link local address and you have firmware below V3.0 when you upgrade the switch be aware that after the reboot a new link local address will be assigned.

If the switch has firmware V3.0 or above the same link local address is used.

**Sync Tx/Rx Firmware**
Upgrades the firmwares of all connected modules to match that of the main switch. Confirmation is required once this button is clicked.

*Note: Be sure that the DDX switch has the latest firmware installed before using this option.*

**Reboot System**
Reboots the switch and all connected Transmitters / Receivers.

**Backup**
Saves a copy of the DDX Matrix system configuration to a file. Backup files are stored on the computer viewing DDX Matrix.

**Restore**
Restores the DDX Matrix system configuration from a backup file. A file dialog will be displayed to allow you to choose the filename and location.

*Note: In order to prevent an incorrect backup file being uploaded to the switch only backup files created with V3.0 and above firmware are restored on a V3.0 switch. Any backup file taken from a switch with 2.0 or less firmware will not be restored on a V3.0 switch.*

**Factory Reset**
Returns all DDX system configuration settings back to their factory defaults.

---

**Recovering an unresponsive transmitter or receiver**
If a firmware upgrade to a transmitter or receiver has failed, the unit may become unresponsive. If so, please follow the advice provided in other sections of this guide:

- Recovering a transmitter
- Recovering a receiver
Maintenance > Settings
This page provides options related to the user interface. When you make a change, you need to click the Update button to save it.

Web UI Mode
When this option is set to Advanced, extra details are shown on certain pages, such as:
• Configure > Central Switch > General
• Configure > Consoles > Receivers
• Configure > Computers > Transmitters
• Maintenance > Diagnostics

Auto Refresh
When this option is set to On, the Dashboard, Control and Diagnostic pages will automatically update their contents every few seconds.

Update
Click this button to save and enact any changes made to options.
### RESETTING AND RECOVERING

There may be rare occasions when the main switch or a module needs to be given a hard reset. The DDX switch and DDX-USR module both have concealed reset buttons for this purpose. You need to use a narrow implement (e.g. a straightened-out paper clip) to press-and-hold the recessed reset button on the front panel:

**DDX switch**

**DDX-USR module**

**DDX switch > Boot into recovery image**

This procedure may be necessary if an attempted firmware upgrade has failed. The switch will load the factory default configuration, requiring you to log-in using the factory default username/password and a freshly determined IP address (see Accessing DDX Matrix). You will be required to accept a new temporary SSL certificate when accessing the web interface. Note: All configuration data (e.g. users, consoles, computers, networking, etc.) will be retained.

1. Press-and-hold the recessed reset button for **ten seconds** until the **STS (Status)** indicator begins to flash slowly.
2. Release the reset button. The **STS** indicator will go out and the switch will boot itself using the recovery image. The **STS** indicator will now begin to flash again to indicate that it is running from the recovery image (a red banner will also be shown at the top of the DDX Matrix screen).
3. When you are sure of operating conditions, such as having good power stability, proceed once again with the firmware upgrade.

**DDX-USR module > Boot into recovery image**

This procedure may be necessary if an attempted firmware upgrade has failed. For such a situation the DDX-USR module always retains a recovery image that will return the unit to a working condition, prior to reattempting a firmware upgrade.

1. Press-and-hold the recessed reset button for **ten seconds** until the **PWR** indicator begins to flash quickly.
2. Release the reset button.
3. When you are sure of operating conditions, such as having good power stability, proceed once again with the firmware upgrade.

**DDX-USR module > Reset**

This procedure may be necessary if a DDX-USR has become unresponsive.

1. Press-and-release the recessed reset button. The DDX-USR module will reboot.

**Recovering an unresponsive transmitter or receiver**

If a firmware upgrade to a transmitter or receiver has failed, the unit may become unresponsive. If so, please follow the advice provided in other sections of this guide:

- **Recovering a transmitter**
- **Recovering a receiver**
Operation

The DDX system is designed to be transparent in operation. A simple OSD (On Screen Display) interface allows each user to view and select from the available host computers.

Note: The default OSD resolution is 1920 x 1080. If your video display does not support this resolution, see **Central Switch > OSD Settings** to choose a setting that suits your screen.

**VIEWING THE OSD**

To view the OSD, either:

- From a console keyboard, press **CTRL + ALT + M**, or
- From a console mouse, press and hold the center button and then press the right button*, or
- From a touchscreen, tap the translucent launch icon (if shown) on the touchscreen*.

The OSD will be displayed:

* OSD access settings

The precise functions or availability of the keyboard, mouse and/or touchscreen access methods are dependent on the settings within the Configure > Consoles page. See **Configure > Consoles > Add a new entry** or **Configure > Consoles > Edit an entry**.

**Thumbnail images**

The outputs of the available host computers will be displayed within live thumbnail images.

Note: If video is not available for a computer, or the Thumbnails option has been set to OFF, a black image will be shown. See **Central Switch > OSD Settings**.

**Switch information**

The additional information in the lower right corner, including the current IP address setting, firmware version and any current firmware upgrade warnings/errors, is displayed within the OSD screen, providing the Display System Info option is set to ON. See **Central Switch > OSD Settings**.

continued
USB Improvements
Version 2.0 of the DDX Switch firmware has the following improvements in USB support over the original v1.03:

- Touchscreens that advertise compatibility with Windows 8 are now supported. Any touchscreens that use proprietary drivers or do not declare Windows 8 support are not supported. Multiple touchscreens are now merged into the combined HID device that the transmitter reports.
- The Adder Free-Flow mouse reported by the CCS-PRO4 is now merged so as only one Free-Flow mouse is reported by the transmitter. Previously, if four receivers were connected to the CCS-PRO4, four different Free-Flow mice would be reported meaning that no other non-emulated USB device could be connected to the receivers.
- Up to five non-emulated USB HID devices can be connected to the transmitter. The transmitter can support up to seven USB devices, but will always report a combined HID device for keyboard/mouse and touchscreen support, and an Audio device for speakers and microphone support.
**USING AUDIO**
The DDX system fully supports stereo audio, with all audio devices being presented at the linked host computer as USB audio devices. There are slight differences in audio operation between DDX devices acting in a simple extender arrangement (without the use of a DDX switch) and a full DDX matrix installation.

**Using audio in a simple extender installation**
The audio is presented to the computer’s operating system as a USB headset with controls for input level, input mute, input AGC, sidetone level, sidetone mute, output level, output mute and output balance. The audio device is permanently presented to the computer when the DDX-CAM module powers up.

You can adjust the audio features using all of the standard operating system controls.

*Note: Due to the architecture of the Codec, adjusting the input (microphone) level or muting the input (microphone) will also affect the sidetone level and mute.*

**Using audio in a full DDX matrix installation**
Audio functionality is enabled by default on all computers. For multi-head computers, audio is only enabled for the primary transmitter, although two audio devices will be presented to the computer, one for each transmitter. For multi-head consoles, audio is only enabled for the primary receiver.

**Managing audio in multi-user situations**
- In all connection modes, the audio output of the computer is routed to the receiver from the transmitter.
- In View Only and Shared modes, the receiver input audio is ignored.
- In Exclusive and Private modes, the receiver input audio is routed to the transmitter.

*Note: The above is equivalent to routing the output audio as per the video and the input audio as per the USB (except in View Only and Shared modes, where the input audio stream is ignored).*

When viewing the OSD selection screen, input and output audio is suppressed.

The user who is currently in control of a computer can adjust the audio levels using the standard operating system audio features; their changes will affect the audio for all other users viewing the same computer. Additional users connected in View Mode, or additional Shared Access users who don’t have control, can listen to the audio but at the volume dictated by the main user. As a user switches between machines, their audio levels are automatically adjusted to match their current connection.
INDICATORS
The DDX switches, the DDX-CAM and DDX-USR modules contain various indicators to provide you with status information.

DDX switch - Red front panel status indicators
The red status indicators on DDX switch front panels provide various key power and operation feedback:

- **Power input A**: This indicator will be on when power is supplied to power socket A.
- **Power input B**: This indicator will be on when power is supplied to power socket B.
- **STS (Status)**:
  - **On**: Running primary firmware image
  - **1Hz flash**: Running backup firmware image
  - **2Hz flash**: Upgrade mode engaged
- **ERR**: Flashing: Either, Power input failed or internal error - refer to the Maintenance > Diagnostics page for details or A firmware mismatch has been detected with one or more connected devices - refer to the Dashboard page for details.

DDX switch - Green and amber network status indicators
The green and amber status indicators on the network link port provide further status information:

- **Amber**:
  - **Off**: 10 or 100Mbps
  - **On**: 1000Mbps
- **Green**:
  - **Off**: No link
  - **Flashing**: Network activity
  - **On**: Quiescent link
**DDX-USR module - Green and amber status indicators**
The green and amber indicators on the link port of each DDX-USR (console/user) module provide the following status information:

**Green**
- Off: No power
- Flashing: Power present but no data link
- On: Power present and link established

**Amber**
- Off: No power
- Slow flashing: Power present but no video or video not locked
- On: Power present and video locked

**DDX-CAM module - Green and amber status indicators**
The green and amber indicators on the link port of each DDX-CAM (computer) module provide the following status information:

**Green**
- Off: No power
- Flashing: Power present but no data link
- On: Power present and link established

**Amber**
- Off: No power
- Slow flashing: Power present but no video
- On: Power present and video locked

**Special condition**
- **PWR on, Amber flashing and Green off:** Software fault requiring the DDX-USR module to be recovered. See Configure > Computers > Transmitters.

**DDX-USR module - Red front panel status indicators**
The red indicators on the front panel of each DDX-USR (console/user) module provide the following status information:

**LNK**
- Off: No power or no link
- Flashing: Switch refused link connection due to incompatible firmware versions
- On: Link established

**USB**
- Off: No power or no active USB connection
- Flashing: USB connection is contended in shared mode (keyboard LEDs also flash)
- On: USB is routed to a DDX-CAM module, either via the DDX switch or directly, in a simple extender installation

**VID**
- Off: No power present or the video is not locked
- On: Power present and video locked

**PWR**
- Off: No power present
- Slow flashing: A firmware upgrade is being forced by the DDX switch
- Fast flashing: Receiver in USB recovery mode
- On: Power present

**Special condition**
- **PWR on, Amber flashing and Green off:** Software fault requiring the DDX-CAM module to be recovered. See Configure > Computers > Transmitters.
GETTING ASSISTANCE
If you are still experiencing problems after checking the information contained within this guide, then we provide a number of other solutions:

- **Online solutions and updates** – [www.adder.com/support](http://www.adder.com/support)
  Check the Support section of the adder.com website for the latest solutions and firmware updates.

- **Technical support** – [www.adder.com/contact-support-form](http://www.adder.com/contact-support-form)
  For technical support, use the contact form in the Support section of the adder.com website - your regional office will then get in contact with you.
### APPENDIX I - LINK CABLE INTERFERENCE PROTECTION

While the Category rating (e.g. CAT 5e, CAT 6a, CAT 7, etc.) determines the electrical performance of a cable, another vital part of the overall cable specification is its protection from interference. As cabling distances and data rates increase, so too does the susceptibility to interference, from both external and internal sources.

Proximity to other electromagnetic sources are the main external threat and these can be subdued using overall screening that surrounds all four of the cable pairs. However, interference is also possible from neighbouring twisted pairs within the same cable and this can be just as hazardous to data integrity. Such crosstalk is countered by shielding each cable pair separately.

Within each Category rating, you can specify different combinations of external screening and internal shielding to suit the environment into which the link is being placed.

#### Interference protection codes

Interference protection is classified in the following manner:

<table>
<thead>
<tr>
<th>Name</th>
<th>Overall Screening</th>
<th>Pair Shielding</th>
</tr>
</thead>
<tbody>
<tr>
<td>U/UTP</td>
<td>×</td>
<td>×</td>
</tr>
<tr>
<td>F/UTP</td>
<td>✓</td>
<td>×</td>
</tr>
<tr>
<td>U/FTP</td>
<td>×</td>
<td>✓</td>
</tr>
<tr>
<td>S/FTP or S/STP or PiMF</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>

where
- **U** = unshielded
- **F** = foil shielding
- **S** = braided shielding
- **PiMF** = Pairs in Metal Foil

**Note:** Do not use unshielded cables with the DDX modules.
APPENDIX 2 - Firmware Upgrades for Basic Extender Installations

Extender systems (or individual DDX-USR units) can be upgraded using a USB stick if required. This is carried out as follows:

1. Connect the DDX-USR to a compatible display and keyboard; optionally connect to a DDX-CAM module using a Shielded CAT6a or CAT7 data cable to upgrade it at the same time.

2. On the DDX-USR unit, insert a FAT32-formatted USB stick containing the extender firmware upgrade file into one of the front USB ports. Note: The extender firmware upgrade file must be in the root folder.

3. Apply power to the DDX-USR unit and DDX-CAM modules.
   IMPORTANT: Ensure power remains uninterrupted throughout the upgrade process.

4. Press-and-hold the recessed reset button for ten seconds until the PWR indicator begins to flash quickly, then release the reset button.

5. When prompted, type in the name of the extender firmware upgrade file and press Enter.

6. Type Y or N as appropriate, when asked if an attached (DDX-CAM) transmitter unit should also be upgraded.

7. The display will show the upgrade progress and confirmation message.

8. If successful the DDX-USR and DDX-CAM modules will automatically be rebooted and the USB stick can be removed.

APPENDIX 3 - Open Source Licenses

This product includes binaries that are derived from the open source community. The modules listed below are licenced under the GNU General Public License v2 and must be provided, in source form, on request:

- u-boot
- linux-arm-freescale
- busybox
- termcap
- iproute
- iperf
- hotplug
- udev
- kobs-ng
- freetype
- i2c-tools

This product includes binaries that are derived from the open source community. The modules listed below are licenced under the GNU Lesser General Public License v2.1 and must be provided, in source form, on request:

- libconfig
- directfb
- libdaemon
- nss-mdns
- avahi

In addition to the GPL modules listed, this product also includes binaries derived from 3rd party open sources that have their own license requirements. Each module is listed below with their required copyright statement and distribution conditions.

Module: iperf

"iperf, Copyright (c) 2014-2016, The Regents of the University of California, through Lawrence Berkeley National Laboratory (subject to receipt of any required approvals from the U.S. Dept. of Energy). All rights reserved."

Module: openssl

LICENSE ISSUES

The OpenSSL toolkit stays under a dual license, i.e. both the conditions of the OpenSSL License and the original SSLeay license apply to the toolkit. See below for the actual license texts. Actually both licenses are BSD-style Open Source licenses. In case of any license issues related to OpenSSL please contact openssl-core@openssl.org.

OpenSSL License

Copyright (c) 1998-2011 The OpenSSL Project. All rights reserved.
Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:
1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgment:
   “This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit. (http://www.openssl.org/)”
4. The names “OpenSSL Toolkit” and “OpenSSL Project” must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact openssl-core@openssl.org.
5. Products derived from this software may not be called “OpenSSL” nor may “OpenSSL” appear in their names without prior written permission of the OpenSSL Project.
6. Redistributions of any form whatsoever must retain the following acknowledgment:
   “This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/)”

THIS SOFTWARE IS PROVIDED BY THE OpenSSL PROJECT "AS IS" AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE OPENSSL PROJECT OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.
This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

Original SSLeay License
Copyright (C) 1995-1998 Eric Young (eay@cryptsoft.com)
All rights reserved.

This package is an SSL implementation written by Eric Young (eay@cryptsoft.com).
The implementation was written so as to conform with Netscape's SSL.
This library is free for commercial and non-commercial use as long as the following conditions are adhered to. The following conditions apply to all code found in this distribution, be it the RC4, RSA, Lhash, DES, etc., code; not just the SSL code. The SSL documentation included with this distribution is covered by the same copyright terms except that the holder is Tim Hudson (tjh@cryptsoft.com).

Copyright remains Eric Young's, and as such any Copyright notices in the code are not to be removed. If this package is used in a product, Eric Young should be given attribution as the author of the parts of the library used. This can be in the form of a textual message at program startup or in documentation (online or textual) provided with the package.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:
1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgement:
   "This product includes cryptographic software written by Eric Young (eay@cryptsoft.com)"
   The word 'cryptographic' can be left out if the routines from the library being used are not cryptographic related :-).
4. If you include any Windows specific code (or a derivative thereof) from the apps directory (application code) you must include an acknowledgement:
   "This product includes software written by Tim Hudson (tjh@cryptsoft.com)"

THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The licence and distribution terms for any publically available version or derivative of this code cannot be changed. i.e. this code cannot simply be copied and put under another distribution licence [including the GNU Public Licence.]

SAFETY INFORMATION

- For use in dry, oil free indoor environments only.
- Warning - live parts contained within power adapter(s).
- No user serviceable parts within power adapter(s) - do not dismantle.
- Plug the power adapter(s) into socket outlets close to the module that they are powering.
- Do not use an unearthed power socket or extension cable.
- Do not use a power adapter if its case becomes damaged, cracked or broken or if you suspect that it is not operating properly.
- Replace the power adapter(s) with a manufacturer approved type only.
- If you use a power extension cord with the module, make sure the total ampere rating of the devices plugged into the extension cord does not exceed the cord’s ampere rating. Also, make sure that the total ampere rating of all the devices plugged into the wall outlet does not exceed the wall outlet’s ampere rating.
- Do not attempt to service the modules yourself.

WARRANTY

Adder Technology Ltd warrants that this product shall be free from defects in workmanship and materials for a period of two years from the date of original purchase. If the product should fail to operate correctly in normal use during the warranty period, Adder will replace or repair it free of charge. No liability can be accepted for damage due to misuse or circumstances outside Adder’s control. Also Adder will not be responsible for any loss, damage or injury arising directly or indirectly from the use of this product. Adder’s total liability under the terms of this warranty shall in all circumstances be limited to the replacement value of this product.

If any difficulty is experienced in the installation or use of this product that you are unable to resolve, please see the Getting assistance section.
RADIO FREQUENCY ENERGY

A Category 5e (or better) twisted pair cable must be used to connect the units in order to maintain compliance with radio frequency energy emission regulations and ensure a suitably high level of immunity to electromagnetic disturbances.

All cables used with this equipment must be shielded in order to maintain compliance with radio frequency energy emission regulations and ensure a suitably high level of immunity to electromagnetic disturbances.

European EMC directive 2004/108/EC

This equipment has been tested and found to comply with the limits for a class A computing device in accordance with the specifications in the European standard EN55032. These limits are designed to provide reasonable protection against harmful interference. This equipment generates, uses and can radiate radio frequency energy and if not installed and used in accordance with the instructions may cause harmful interference to radio or television reception. However, there is no guarantee that harmful interference will not occur in a particular installation. If this equipment does cause interference to radio or television reception, which can be determined by turning the equipment on and off, the user is encouraged to correct the interference with one or more of the following measures: (a) Reorient or relocate the receiving antenna. (b) Increase the separation between the equipment and the receiver. (c) Connect the equipment to an outlet on a circuit different from that to which the receiver is connected. (d) Consult the supplier or an experienced radio/TV technician for help.

FCC Compliance Statement (United States)

This equipment generates, uses and can radiate radio frequency energy and if not installed and used properly, that is, in strict accordance with the manufacturer’s instructions, may cause interference to radio communication. It has been tested and found to comply with the limits for a class A computing device in accordance with the specifications in Subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against such interference when the equipment is operated in a commercial environment. Operation of this equipment in a residential area may cause interference, in which case the user at his own expense will be required to take whatever measures may be necessary to correct the interference. Changes or modifications not expressly approved by the manufacturer could void the user’s authority to operate the equipment.

Canadian Department of Communications RFI statement

This equipment does not exceed the class A limits for radio noise emissions from digital apparatus set out in the radio interference regulations of the Canadian Department of Communications.

Le présent appareil numérique n’émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la classe A prescrites dans le règlement sur le brouillage radioélectriques publié par le ministère des Communications du Canada.
